### DEPENDABLE INTERNET OF THINGS IN ADVERSE ENVIRONMENTS

# Motivation

## In UWB research focus on localization. Maximizing dependability for UWB communications, instead, is still unexplored

- Energy-efficiency: UWB radios are more energy-hungry than narrowband IoT transceivers Reliability: essential to reliably acquire and share the timestamps in the network

## Characterization of the numerous 802.15.4 UWB PHY settings is missing

- PHY settings have huge impact on dependability
- Changing them helps to overcome a degrading channel

## Need for runtime adaptation

To date, UWB systems make use of static PHY settings independent on dynamic environment

- Estimating the link quality for UWB not thoroughly investigated
  - Link quality estimation is required to trigger the adaptation of the PHY settings

Characterize and quantify the impact of the different PHY (1) settings on the dependability of UWB transceivers Rank PHY settings depending on characterization (2)application requirements

Use PHY information to estimate link quality and (3) extract information about the surrounding environment

# Characterizing UWB performance

### **Experimental setup:**

- Decawave DW1000 UWB transceiver (EVB1000 boards)
- Cable-based single link setup (TX, RX)
- Used programmable attenuator in between to simulate a degrading channel in a reproducible manner
- 1000 packets per attenuation and setting

Packet Reception Rate (PRR) = 
$$\frac{\# of r}{\# of}$$

# of valid SHR received Header Reception Rate (HRR) =*# of sent packets*

# Impact of PHY settings (e.g., PSR, DR)

**Preamble Symbol Repetitions (PSR)** 

![](_page_11_Figure_3.jpeg)

- Energy efficiency (TX+RX SHR):
  - PSR=4096: 30.2x less efficient

DR=850kbps: 1.55x less efficient PSR=1024: 7.6x less Based on characterization we can derive a rank of settings in order to satisfy the application requirements.

# **Reminder: Outline & Contributions**

![](_page_12_Figure_2.jpeg)

Use PHY information to estimate link quality and (3)extract knowledge about surrounding environment

![](_page_12_Picture_5.jpeg)

![](_page_12_Picture_6.jpeg)

![](_page_13_Picture_0.jpeg)

# Background: Channel impulse response

- UWB transceivers provide an estimate of the channel impulse response; derived from the preamble in the SHR
- Provides information about the multipath propagation and, thus, the environment

![](_page_13_Figure_4.jpeg)

Used to precisely estimate the arrival time of a packet

![](_page_13_Picture_7.jpeg)

![](_page_13_Picture_10.jpeg)

![](_page_14_Picture_0.jpeg)

# Estimating the link state

We use CIR to estimate the link quality and extract environmental info UWB link state indicator

![](_page_14_Figure_3.jpeg)

![](_page_14_Picture_5.jpeg)

# (Link quality + environmental state = link state)

- LOS/NLOS, destructive interference,...
- Detect the cause of a degrading channel

![](_page_15_Picture_0.jpeg)

# **Detecting destructive interference**

- Measurement campaign in corridor at campus
- PRR shows deep fades

![](_page_15_Figure_4.jpeg)

CIR used to detect the cause of degraded channel

### → Huge impact on adaptation logic

![](_page_16_Picture_0.jpeg)

## **Evaluation I – Irregular fluctuations**

![](_page_16_Figure_2.jpeg)

![](_page_16_Picture_4.jpeg)

![](_page_17_Picture_0.jpeg)

## **Evaluation II – Destructive interference**

![](_page_17_Figure_2.jpeg)

![](_page_17_Picture_4.jpeg)

![](_page_18_Picture_0.jpeg)

## Conclusions

- We have exploited UWB PHY settings as tuning knobs to increase the dependability of communications
- We quantified the reliability and energy cost of each setting to know which one(s) to privilege depending on the application requirements
- We used the CIR to estimate the link quality and extract information about the environment
- Designed an adaptation scheme that adapts UWB PHY settings at runtime
- Evaluated the performance of the adaptation scheme in a real-world experiment Thanks.
